Applied Regression Analysis: A Research Tool, Second Edition

In statistics, linear regression is a linear approach to modelling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables). The case of one explanatory variable is called simple linear regression. For more than one explanatory variable, the process is called linear regression. ...

The output from the logistic regression analysis gives a p-value of $=$, which is based on the Wald z-score. Rather than the Wald method, the recommended method [citation needed] to calculate the p-value for logistic regression is the likelihood-ratio test (LRT), which for this data gives $=$. Discussion. Logistic regression can be binomial, ordinal or multinomial.

1.. Introduction In this article we review a particular type of multivariate analysis, namely PLS-regression, which uses the two-block predictive PLS model to model the relationship between two matrices, X and Y. In addition PLSR models the "structure" of X and of Y, which gives richer results than the traditional multiple regression approach. PLSR and similar approaches provide quantitative ...

Applied Behavior Analysis. Applied behavior analysis (ABA) is the process of applying interventions that are based on the principles of learning derived from experimental psychology research to systematically change behavior and to demonstrate that the interventions used are responsible for the observable improvement in behavior.
